

DRP-EA-ST

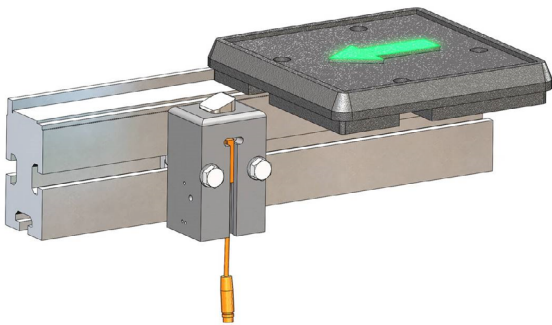

Undamped stopper with reversable limit stop in reversing mode

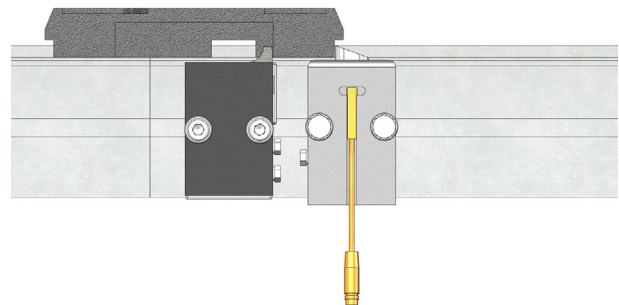

Flexible stopper solution with three functions in one device, reducing your product variety and stock

You want to reliably stop a pallet in forward operation without influence in reverse operation?

The new DRP-EA-ST is a versatile stopper solution from Wörner with three different functions that can be used individually or in combination.

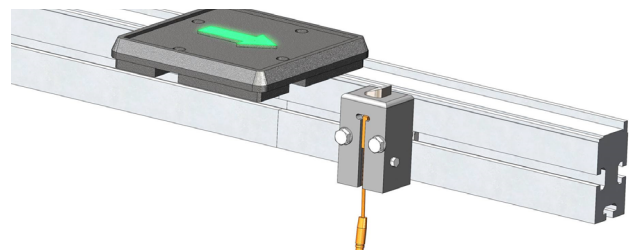

In forward operation the unit can be used as a simple undamped stopper.

Mounted the other way round, the DRP-EA-ST serves as a classic backstop, which locks the pallet at the stop point.

In a third application, the device is used in forward operation as a normal stopper. Now the pallet can be moved backwards, e.g. for revision or testing purposes, and simply drives over the DRP-EA-ST without any pneumatic support.

Thus, the new solution reduces your product variety and the necessary stock. It is made of high solid aluminium, equipped with a special plasma-nitrided steel stop and has been subjected to extensive practical tests.

Another highlight is the position query directly at the stop. The position „retracted” is also reported when the pallet passes the stopper, even though the lowering mechanism is not pneumatically active in this case.

Enjoy a simple, functional and inexpensive solution for your stopper tasks. Maybe an idea for your next project? Or do you have another special separating or positioning task?

In addition to our standard program, your Wörner sales team will always have an open ear for it.
